

**PORTABLE, STACKED CONTAINER AND METHOD FOR  
SEPARATELY STORING AND DISPENSING TWO CONSUMABLE  
PRODUCTS, ESPECIALLY CEREAL AND MILK**

5

**Abstract of the Disclosure**

A portable, single-use container for separately containing a dry consumable product and a liquid consumable product. The container includes a first, outer compartment; a second, inner compartment; and a cover. The first compartment includes a bottom, a first compartment side wall and an annular rim. The first compartment side wall extends from the bottom and defines a first  
10 compartment internal storage region. The annular rim is formed at a top of the first compartment side wall. The second compartment similarly includes a base, a second compartment side wall, and an annular lip. The second compartment side wall extends from the base and defines a second compartment internal  
15 storage region. The annular lip is formed at the top of a second compartment side wall, defining a dry product opening and forming a pour opening. The dry product opening provides access to the internal storage region. The pour opening is positioned along the annular lip so as to be offset from the dry product opening. Finally, the cover is secured to the lip, encompassing both the  
20 dry product opening and the pour opening. Upon final assembly, the second compartment nests within the first compartment such that the lip abuts the rim. Further, a fluid passageway is established between an interior surface of the first compartment side wall and an exterior surface of the second compartment side wall. The fluid passageway fluidly connects the first compartment internal  
25 storage region and the pour opening. During use, a liquid consumable product, otherwise disposed within the first compartment, can be dispensed through the pour opening substantially concurrently with dispensement of a dry consumable product from the dry product opening.
